## Background

Purpose: To determine a hierarchy of "correctness" on a commonly used multiple-choice assessment in introductory physics courses.

- Data were collected from over 7,000 students
- We omit $J$ as an answer choice because it provides no understanding of a student's understanding.

## Item Response Theory

- Assumption: Students who choose correct responses on most questions are more likely to choose more sophisticated incorrect answers than students who choose few correct responses [2] 2-parameter nested logit model for a multiple choice test $[3,4]$

Correct: $P(\theta)=\frac{1}{1+e^{-a(\theta-b)}}$

- a: related to slope of the item response curve (IRC)
- Discriminates student understanding
- $b$ : Difficulty of the question
- Right shift means harder question
- Left shift means easier question

Incorrect: $P_{k}(\theta)=\left(1-\frac{1}{1+e^{-a(\theta-b)}}\right) \frac{e^{a_{k}\left(\theta-b_{k}\right)}}{\sum e^{a_{i}\left(\theta-b_{i}\right)}}$

- Correctness of answer choices determined by higher $a_{k}$ value

[^0]
## Force and Motion Concept Evaluation [1]

Assume that friction is so small that it can be ignored. A force is applied to the car. Choose the one force graph (A through H) that for each statement below which could allow the described motion of the car.

__18. The car moves toward the right and is slowing down at a steady rate (constant acceleration).

## Hypotheses

$\mathbf{H}_{0}$ : The number of transitions from one answer choice to another is the same in both directions
$H_{a}$ : More students transition in one direction between two answer choices than in the other

## McNemar-Bowker Chi-Square

 Test for AsymmetryAssumption: Students are more likely to choose more sophisticated responses after instruction than before instruction Using the False Discovery Rate (FDR) correction, the adjusted $p$-value determines whether or not a transition is statistically significant $[5,6]$

|  | Posttest |  |  |  |  |  |  |  |  |

We thank Sam McKagan and Ellie Sayre for providing access to data from PhysPort's Data Explorer. We also thank Kerry Gray, Nicholas Wright, lan Grifitin,
and Ryan Moyer for their previous contributions as members of the research team.

## Future Research

- Determining the models for each answer choice via interviews
- Synthesize results into a unified ranking system
- Use additional analyses to rank responses with different assumptions
